

The Eyes of Science

... *i*mage perfection in digital microscopy

ECLIPSE
90*i* / 80*i*

Responding to demand, Nikon has developed a series of research-level microscopes that are superbly optimized for digital imaging. Unique “fly-eye” optics and VC-series objectives enable the ECLIPSE 90i and 80i to capture images with excellent resolution and uniform brightness up to the edges. With low-noise fluorescence imaging capability and DIC flexibility, these trailblazing microscopes comprehensively support researchers in the front lines of science.

ECLIPSE
90i/80i

Definitive digital imaging . . . optimal performance and efficiency

ECLIPSE 90i—motorized advanced research microscope with seamless PC interface

ECLIPSE 80i—advanced research microscope that grows with your research

Perfect optics for digital imaging—ECLIPSE 90i and 80i

“Fly-eye” optics ensure uniform illumination

A revolutionary “fly-eye” lens array built into the main body provides uniform illumination throughout the visual field—perfect for digital imaging.

Conception of “fly-eye” optics

Fly-eye lens

Plan Apo VC objectives deliver high-resolution images, right to the edge

- Shading has been eliminated up to the peripheries to ensure optimum digital-imaging performance.
- Chromatic aberration has also been corrected, even at the h-line (405nm), providing excellent resolution over the whole view field. These objectives are especially suitable for confocal and multi-stained fluorescence microscopy.
- The 60X water immersion objective provides high UV transmittance, even in the 360nm region.

CFI Plan Apo VC 60XWI, VC 100X Oil, VC 60X Oil

Pictured by Momoki Hirai, Professor, Department of Integrated Biosciences, Graduate School of Frontier Sciences, The University of Tokyo.

Excellent fluorescence imaging capabilities

To ensure brighter, higher contrast fluorescence images, noise factors have been thoroughly eliminated in the new epi-fluorescence illuminator.

Noise Terminator boosts S/N ratios

Nikon's unique Noise Terminator eliminates stray light that causes noise in fluorescence images. You can capture clear, high-contrast images with an S/N ratio five times that of previous models.

Stray light is thoroughly eliminated from the optical path in the filter turret.

Excitation Balancer continuously adjusts excitation wavelength (Optional)

The operator can use the Excitation Balancer to continuously change the spectral intensity of each excitation wavelength without changing the filter cube during observations of multistained specimens.

TRITC is emphasized.

Standard triple-band excitation is shown.

DAPI is emphasized.

Excitation wavelength can be adjusted by gradually sliding the excitation balancer.

Six-filter turret

The filter turret can accommodate up to six filter cubes, and changing them is a breeze. The names and positions of the filter cubes are displayed with phosphorescent labels for easy identification in darkened rooms. The filters or dichroic mirrors in the filter cubes can be easily replaced to create the intended combination.

Flexible DIC system perfect for individual specimens

- Excellent images with uniform coloration even at low magnification.
- When using dry condensers, you can select from three DIC prism types (best-balanced standard, high contrast, high resolution) to perfectly match individual specimens.
- The shear angle (3D effect) of an image can be adjusted when a rotatable stage is used.

MDCK Cells
Dr. Shuichi Obata, Kitasato University

eclipse 90i—motorized model with seamless PC interface

For automated observation and imaging

High-precision motorized focus

Feedback from a linear encoder showing vertical movement enables high-precision focus control in 0.05µm increments, facilitating high-resolution deconvolution, confocal and other techniques.

Diverse motorized control

... from buttons on the 90i main body

The 90i's operating controls and switches are concentrated around the focus knob, enabling smooth observation and imaging while viewing the image.

- 1 Coarse/fine/super-fine focus switching
- 2 Refocusing switch (ESCAPE)
- 3 Objective switching
- 4 Optical path switching
- 5 Aperture diaphragm open/close
- 6 Fluorescence filter cube switching
- 7 Field diaphragm open/close
- 8 Coarse/fine/super-fine focus switching
- 9 Excitation light shutter open/close

Note: The allocation of a function to each button can be altered.

... with mouse-clicks in the PC monitor GUI

- Microscope-control software, iControl, enables the operator to operate the 90i via mouse clicks on a PC, while displaying microscope status in GUI.
- By remotely controlling the microscope and cameras from a PC outside the darkroom, the microscope is not affected by heat and light generated by the PC.

... from camera control unit DS-L2

The 90i can be operated directly from the DS-L2 standalone camera control unit without a PC connection, via the GUI of the built-in LCD monitor.

... via Ergo controller

The Ergo Controller comes with an actual stage handle and focus knob, so the stage and focus are controlled seamlessly just like an actual microscope. Also provided are buttons for frequently-used functions, and the allocation of a function to each button can be altered.

Practical automated observation

Auto adjustment interacting with the objective changeover

The following settings of each motorized part are automatically optimized for the objective in use:

- Field diaphragm
- Motorized ND filter unit
- Universal condenser aperture diaphragm
- Z-axis travel amount
- Motorized stage travel speed

One-click switching of observation methods

Switching the observation method, e.g. from DIC to epi-fluorescence, is as easy as clicking on the desired method in the GUI. Setting preferences for each user can be registered.

Auto link focus

Deviation in parfocal distance is automatically corrected with the change of the objective. This dramatically reduces the time taken for focus adjustments.

iControl microscope control software

Displays current microscope status in the GUI of the monitor. You can remotely control the motorized units of the 90i by clicking the GUI.

Efficient automated observation and imaging

In combination with a Digital Sight-series digital camera, it will enhance imaging convenience.

Auto recording of imaging data

Status data of the microscope, e.g. objective magnification and fluorescence filter in use, is automatically detected. Data can be saved with the image.

Auto focusing (brightfield)

Auto focusing during brightfield observation is possible utilizing contrast information from the camera.

Integrated control of microscope and camera

- Major operations of the 90i can be performed with clicks using NIS-Elements imaging software that has been developed to offer total software solutions from image capture, through archiving and analysis to management.
- Time-lapse imaging and Z-axis stack imaging can be easily programmed as microscope and camera are controlled in synchronization.

Customize your own system

The 90i/80i has been developed with emphasis on expandability. You can create the optimum system for your research needs, by freely selecting the microscope, digital-imaging head, and camera system. Motorized sections of the microscope, digital-imaging head and a Digital Sight series digital camera system can be controlled via common application software.

Microscopes

ECLIPSE 90i: Motorized model

The focus and field diaphragm have been motorized as standard. Desired sections can be additionally motorized with optional motorized accessories.

ECLIPSE 80i: Manual model

Digital-imaging heads

Both the DIH-E (motorized) and DIH-M (manual) integrate a Hi S/N epi-fluorescence illuminator, binocular tube, dual ports, and optical zoom, into a single unit. This allows signals from each piece of equipment to be centrally controlled, enabling advanced imaging of fluorescence images.

Simple operation

With the DIH-E model, the following operations have been motorized, and can be controlled from a PC GUI or the Ergo Controller.

- Optical path changeover
- Fluorescence filter changeover
- Excitation light shutter
- Fluorescence field diaphragm
- Optical zoom
- Analyzer

The DIH-M is a manual model, with only the epi-fl shutter motor-controllable with a hand switch.

DIH-E: Motorized model

DIH-M: Manual model (only epi-fl shutter motorized)

Auto recording of status data

When it is combined with a Digital Sight-series digital camera, the status data, such as fluorescence filter in use, and zoom magnification, is automatically recorded as a text file along with the captured image. This feature is extremely convenient for managing the histories of large quantities of images taken under different conditions.

Optical zoom

The rear camera port is equipped with a 0.8X–2.0X optical zoom to allow digital images to be captured at the desired magnification. Unlike digital zoom, the optical zoom provides high-definition images.

Dual ports

Two types of cameras can be mounted simultaneously. The front port, in particular, has a design in which the loss of light is minimized, so it is ideal for quantitative analysis or confocal applications.

ECLIPSE
80iECLIPSE
90i

The right answers for all imaging tasks

Digital Sight series digital camera system

Auto detection of image capture data

The DS-U2 and DS-L2 automatically detect the status of the 90i/80i* and the digital-imaging head — including objective magnification, fluorescence filter in use and zoom magnification—and records it simultaneously with image save. This feature is extremely convenient for managing the history log of images taken under different conditions.

* Objective in use can be detected with the 80i depending on configuration.

Auto focus function (with 90i)

When configured with the Eclipse 90i for brightfield microscopy, auto focusing is possible utilizing the contrast information provided from the camera.

Great freedom of choice

Seven types of camera heads and two types of control units are available. Select the combination best suited to your purpose.

Ultrahigh-resolution cooled color camera head DS-Ri1

- 12.7-megapixel, 2200TV line high-definition images
- Faithful reproduction of specimen color
- Smooth display of live images
- Reduces heat noise; captures fluorescence and darkfield images clearly

High-sensitivity cooled monochrome camera head DS-Qi1

- High sensitivity equivalent to ISO 800
- Cooling mechanism reduces dark current to 0.7e-/pixel/s and readout noise to 8e- rms, realizing a wide dynamic range
- Superior quantitivity with linearity of >98%

High-definition cooled color camera head DS-5Mc

- Cooling mechanism retains CCD at room temperature minus 20°C
- Reduces heat noise. Captures fluorescence and darkfield images clearly
- High-definition 5.0-megapixel color CCD

High-speed cooled monochrome camera head DS-2MBWc

- Cooling mechanism retains CCD at room temperature minus 20°C
- Reduces heat noise. Captures fluorescence and darkfield images clearly
- High-frame-rate and high-sensitivity 2.0-megapixel monochrome CCD
- Smooth display of live images
- Reduces photobleaching due to shorter shooting time

High-definition color camera head DS-Fi1

- High-definition 5.0-megapixel color CCD
- High resolution and high frame rate
- High dynamic range and accurate color reproduction
- Reduces noise

High-speed color camera head DS-2Mv

- High frame rate, 2.0-megapixel color CCD
- Smooth display of live images. Suitable for monitoring of microscopy images

High-speed monochrome camera head DS-2MBW

- High-frame-rate and high-sensitivity 2.0-megapixel monochrome CCD
- Smooth display of live images
- Reduces photobleaching due to shorter shooting time

PC-use control unit DS-U2

- Versatile image capture, processing, measurement and analysis when coupled with imaging software NIS-Elements
- High-speed image transfer to PC via USB 2.0 connection
- Compact, space-saving design
- Allows control of Nikon motorized microscopes

Standalone control unit DS-L2

- Built-in high-definition 8.4-in. large LCD monitor
- Camera can be operated via the GUI of the LCD monitor, eliminating the necessity of PC connection
- Pre-programmed imaging modes for different observation methods
- Allows control of the Nikon motorized microscope 90i

Confocal microscope A1R/A1 (compatible with 90i only) NEW

The ultimate confocal microscope A1 with high performance and A1R with additional high-speed resonant scanner, provide exceptional image quality and stunning bright images.

- The A1R with a revolutionary hybrid scanner realizes ultrafast and high-resolution imaging. Its high-speed imaging at 230 fps (512 x 64 pixels) allows simultaneous imaging and photo activation.
- High-resolution imaging up to 4096 x 4096 pixels.
- Dichroic mirror with 30% increased fluorescence efficiency provides high image quality.
- Just adding spectral detector, ultrafast spectral acquisition and realtime unmixing is possible. (A1si/A1Rsi system)
- Powerful, intuitive software realizes integrated control of both 90i and A1/A1R system.
- With the VAAS pinhole unit, brighter images with less flare can be acquired. Moreover, different sectioning can be simulated after image acquisition.

True spectral imaging confocal microscope system C1si

Simultaneous acquisition of 32 channels is possible with one scan. This reduces imaging time and enables the capture of detailed spectral time-lapse images. Accurate and reliable spectral acquisition realizes the observation in true colors.

- One-shot acquisition of a broad 320nm wavelength range.
- Nikon's proprietary polarization control technology and signal processing system greatly reduce signal loss and increase brightness.
- Greatly overlapping wavelengths of fluorescent labels are cleanly separated for images with no spectral crosstalk.
- Wavelength resolution can be set to 2.5nm, 5nm or 10nm.
- Switching between the spectral detector and a standard fluorescence detector is possible.

A glimpse at typical applications

Perfect choice for those who want total automation

ECLIPSE 90i configured with the confocal microscopy system A1 and a dedicated digital imaging head.

Since processes up to image capture are performed automatically, you can focus more energy on tasks that will follow, such as analysis and research.

- The whole system can be controlled via a PC on the comprehensive GUI.
- Switching observation methods, such as from epi-fluorescence to confocal, can be carried out just at the single click of the mouse.
- The ability to capture images with greater precision in the z-axis direction makes this setup most suitable for confocal and deconvolution applications.
- Timelapse, Z-stack applications are available.
- CFI60 Plan Apo VC objectives are perfect for confocal imaging as axial chromatic aberration has been corrected up to 405nm (h-line).
- A motorized XY stage is also available to complete the motorized system.

A PC-less manual system, for easy capturing high-contrast fluorescence images

ECLIPSE 80i configured with universal epi-fluorescence illuminator, trinocular tube, and digital camera DS-5Mc-L2.

Clear, noiseless fluorescence images are obtainable without a PC.

- The image and microscope settings can be checked on a compact 6.3-inch monitor and saved in a CompactFlash card with one click.
- Images can be easily shared and managed over the network, utilizing the network function of the DS-L2 camera controller.

Pictured by Naoyuki Miyokawa,
M.D., Ph.D., Associate Professor,
Dept. of Surgical Pathology,
Asahikawa Medical College Hospital.

Motorized control of frequently-used sections

ECLIPSE 80i configured with the motorized digital imaging head DIH-E, and digital camera DS-5Mc-U2.

If you do not need total automation, desired sections can be partly motorized according to your application by choosing appropriate accessories. For example, a combination of the 80i and motorized DIH-E enables motorized operation only in the part necessary for frequent fluorescence observation.

- The DIH-E and DS-5Mc can be operated via a common PC software program.
- Image-capture data, such as magnification and the specific protocols used, are automatically detected and saved when the image is captured.
- Low-noise fluorescence images can be captured using the DS-5Mc cooled CCD digital camera and/or a quantitative monochrome CCD camera.

For pathology tests and recording of various cases

ECLIPSE 80i configured with ergonomic tube, DSC port, and digital camera DS-2Mv-L2.

A digital-optimized optical system facilitates the capture of high-definition, crisp, clear images in digital format.

- “Fly-eye” lens array optics ensure uniform illumination.
- Ergonomic tube enables natural posture and reduces fatigue during long hours of observation.
- Specimen holder for one slide is also available to facilitate specimen exchange with one hand.
- The DS-2Mv-L2 digital camera is space-saving and enables easy imaging without a PC.

The most ergonomic system ever ...

Ergo Controller enables 90i operation in front of a PC

The 90i, digital-imaging head, and a Digital Sight digital camera can be operated via the Ergo Controller. The Ergo Controller, which can be operated as if you are sitting in front of and operating the actual microscope, allows focus adjustment and stage movement* to be performed while capturing images in front of the PC monitor. The allocation of a function to each button can be altered.

*When the motorized XY stage is mounted.

Ergonomic tube

The ergonomic binocular-eyepiece tube can be inclined at angles from 10° to 30° and the eyepieces can be extended up to 40mm. This ensures an optimum eye point and comfortable viewing posture, regardless of the operator's physique or if intermediate modules have been attached.

DSC port for the ergonomic tube

A C-mount digital camera can be attached to the ergonomic tube. It includes a 0.7X lens that can optimize the frame of the image to be captured to a 2/3-inch CCD.

Eye-level riser

The eye-level riser can raise the eye-point height in 25mm increments, up to a maximum of 100mm*, to suit individual requirements.

*The number of risers that can be used at any one time depends on the tube or intermediate modules being used.

Stay-in-position stage handle

The handle of the rotatable mechanical stage stays at a fixed position near the focusing knob throughout the full range of X/Y stage movement, so the operator's hand can remain comfortably on the desk at the same position, even when observation points are repeatedly changed. The height- and tension-adjustable stage handle can be set to suit each operator.

High-strength body supports comfortable viewing

The stability of the microscope body has been greatly improved to maintain excellent stability and eliminate image shifts during observations at high magnifications. The stage surface has been coated with a smooth, superhard Alumite treatment to protect it from scratches during specimen exchanges.

Hi S/N epi-fluorescence microscopy

The Noise Terminator eliminates stray light leaking from the filter cube to produce high-contrast images with greater S/N ratios when observing weakly fluorescing specimens. The desired wavelength of a multistained specimen also can be emphasized with the unique Excitation Balancer*.

*Optional

Nomarski DIC microscopy

The new DIC method results in crisp, clear images with perfectly even color, even at low magnifications. Three types of DIC prisms are available to suit the specimen: best-balanced standard, high contrast and high resolution.

Hi S/N epi-fluorescence/DIC microscopy

Fluorescent-tagged structures or proteins can be located and the cellular morphology of specimens visualized using a high-performance DIC method in combination with Hi S/N epi-fluorescence illumination.

Dr. Torsten Wittmann,
The Scripps Research Institute.

... and outstanding in all microscopy methods

Phase-contrast microscopy

Nikon has specially developed its unique Apodized Phase Contrast objectives for phase-contrast microscopy. These objectives visualize minute structures—previously difficult to detect due to annoying halos—with excellent contrast and a much wider tonal range. This is ideal for specimens with varied refractive indices.

Brightfield microscopy

The "fly-eye" lens array in the illumination optics provides uniform brightness to the edge of the view field. The Plan Apo VC objectives provide extraordinarily high resolution over the entire view field. The new 1X-100X condenser visualizes images at any magnifications from ultralow to high, without condenser changes.

Darkfield microscopy

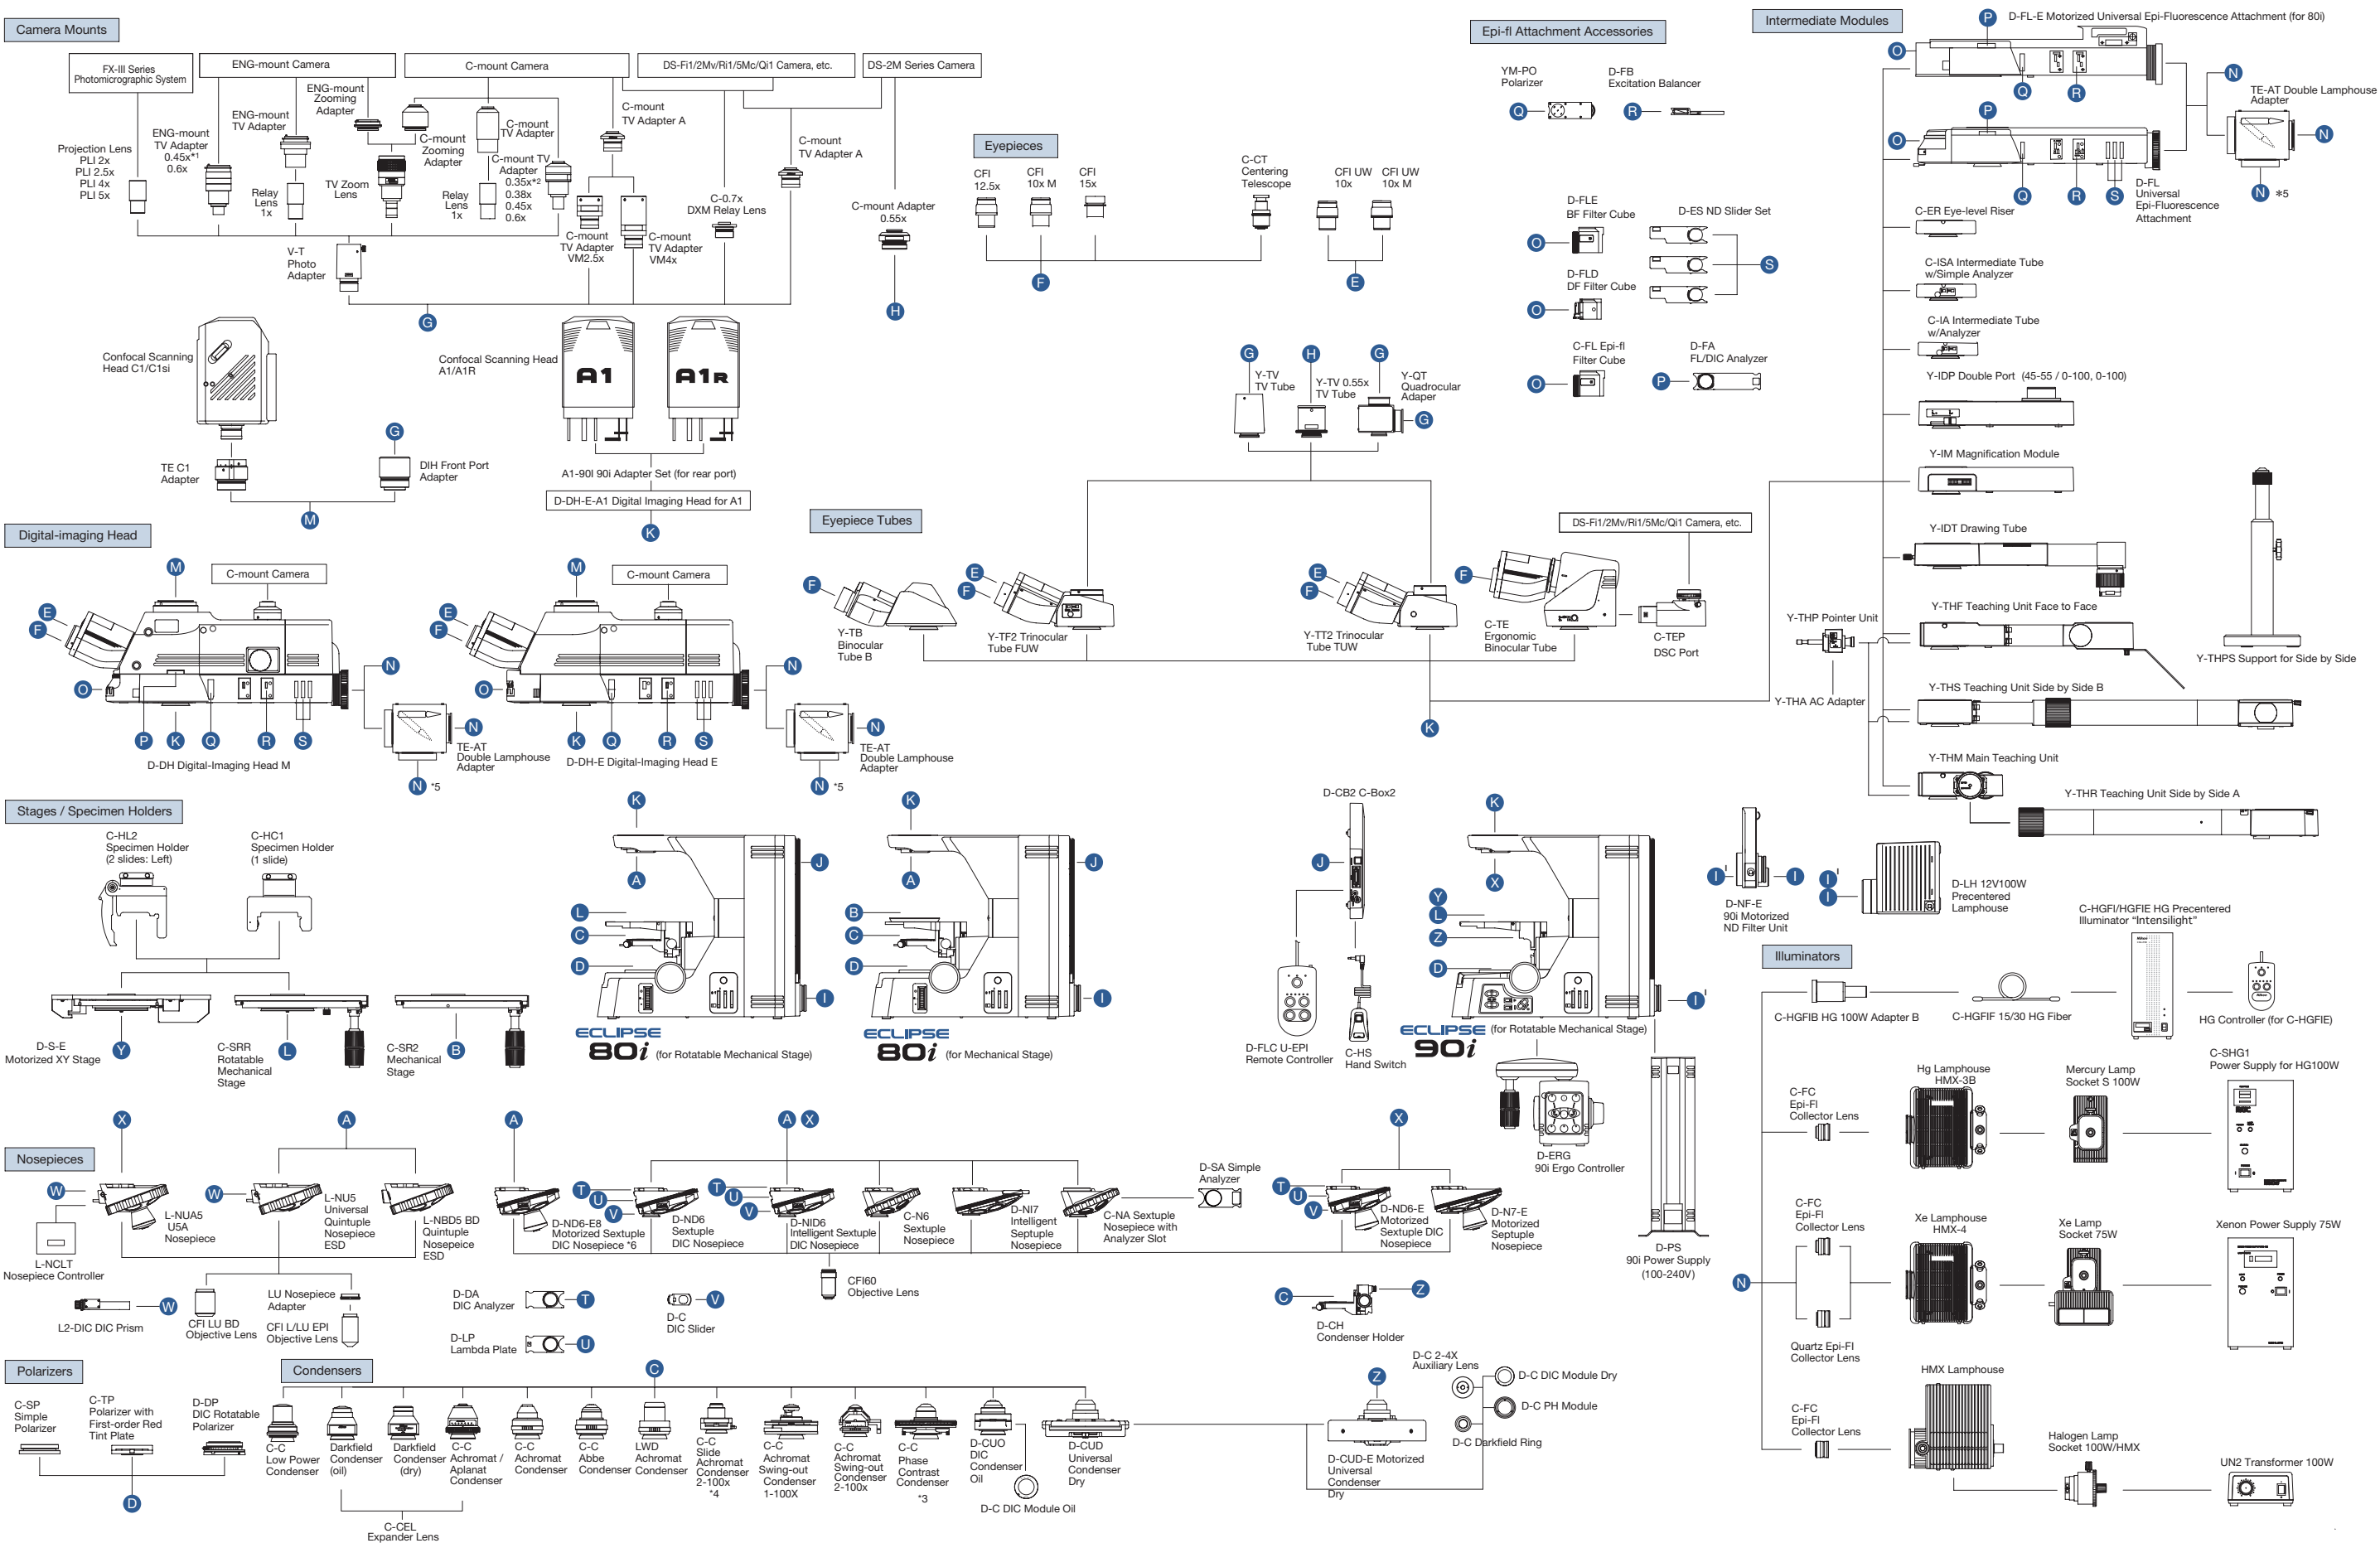

Nikon's dedicated condensers for darkfield microscopy allow clear observation of blood and the minute structure of flagella. Dry- and oil-type condensers are available.

Simple polarizing microscopy

Polarizing microscopy is as simple as inserting a polarizer over the field lens and an analyzer in the arm slot. It is ideal for observing birefringent samples such as collagen, amyloids and crystals.

System Diagram

*1: Use the dedicated 0.45X adapter for the double port sub-port.
The 0.6X adapter cannot be used with the double port sub-port.
*2: Use the dedicated 0.35X adapter for the double port sub-port.
*3: Cannot be used with the 90i and 80i models for rotatable mechanical stage.

*4: Cannot be used with the Achromat/Plan series 4x objective lens.
*5: The Xe lamphouse cannot be attached to the side of the double lamphouse adapter.
*6: Motorized Universal Epi-fluorescence Illuminator is necessary.
